

Model Optimization and Tuning Phase Template

Date	15 July 2024
Team ID	739874
Project Title	Telecom Customer Churn Prediction
Maximum Marks	10 Marks

Model Optimization and Tuning Phase

The Model Optimization and Tuning Phase involves refining machine learning models for peak performance. It includes optimized model code, fine-tuning hyperparameters, comparing performance metrics, and justifying the final model selection for enhanced predictive accuracy and efficiency.

Hyperparameter Tuning Documentation (6 Marks):

Model	Tuned Hyperparameters	Optimal Values

Final Model Selection Justification (2 Marks):

Final Model	Reasoning
	Random Forest is favored for telecom churn prediction due to its high accuracy with complex, feature-rich datasets. It excels in capturing non-linear relationships and interactions while mitigating overfitting through ensemble learning. Feature importance ranking aids in identifying key predictors, and its robustness against data imbalance makes it ideal for detecting churn patterns in telecom customer data.
Random Forest Classifier
